

Exhibit 10 to Complaint
Intellectual Ventures I LLC and Intellectual Ventures II LLC

**Example American Count 3 Systems and Services
U.S. Patent No. 7,949,785 (“the ’785 Patent”)**

The Accused Systems and Services include without limitation American systems and services that utilize Kubernetes; all past, current, and future systems and services that operate in the same or substantially similar manner as the specifically identified systems and services; and all past, current, and future American systems and services that have the same or substantially similar features as the specifically identified systems and services (“Example American Count 3 Systems and Services” or “American Systems and Services”).¹

On information and belief, the American Systems and Services use Kubernetes in its private cloud(s). For example, American posts, or has posted, job opportunities that require familiarity with Kubernetes containerization concepts.

- Example of job listing for an Engineer/Sr Engineer, IT Situational Awareness at American Airlines which requires proficiency in Kubernetes. https://jobs.aa.com/job/EngineerSr-Engineer%2C-IT-Situational-Awareness/75837-en_US (Last accessed on 10/31/2024).
- Example of job listing for an Associate Developer, IT Applications at American Airlines which requires proficiency in Kubernetes. https://jobs.aa.com/job/Associate-Developer%2C-IT-Applications/75816-en_US (Last accessed on 10/31/2024).
- Example of Senior Java Full Stack Developer position at American Airlines which mentions use of Kubernetes. <https://www.linkedin.com/in/rohitha-m6363/> (Last accessed on 9/19/24)
- Example of Sr. Kubernetes Engineer/Architect position at American Airlines which mentions heavy use of Kubernetes. <https://www.linkedin.com/in/sudheer-patchari/> (Last accessed on 9/19/24)
- Example of Kubernetes Engineer position at American Airlines which mentions heavy use of Kubernetes. <https://www.linkedin.com/in/sridhar-pulluri-199b56250/> (Last accessed on 9/19/24)
- Example of Sr. Cloud Infra DevSecOps Engineer/Architect position at American Airlines which mentions use of Kubernetes. <https://www.linkedin.com/in/rupa-m-b90836309/> (Last accessed on 9/19/24)
- Example of DevOps Engineer position at American Airlines which mentions use of Kubernetes. <https://www.linkedin.com/in/manidhar-a-555726169/>.
- Example of Java Developer position at American Airlines which mentions use of Kubernetes. <https://www.linkedin.com/in/suganya-koodalingam-8a0590102/>.

¹ For the avoidance of doubt, Plaintiffs do not accuse public clouds of American if those services are provided by a cloud provider with a license to Plaintiffs’ patents that covers American’s activities. IV will provide relevant license agreements for cloud providers in discovery. To the extent any of these licenses are relevant to American’s activities, Plaintiffs will meet and confer with American about the impact of such license(s).

- Example of Senior Java Developer position at American Airlines which mentions use of Kubernetes.
<https://www.linkedin.com/in/ganesh-kenda/>

As another example, American has announced cloud migration of legacy technology and efforts to modernize its mainframes and servers. Source: <https://dxc.com/sg/en/insights/customer-stories/american-airlines-cloud-data-automation>.

On information and belief, additional information confirms American uses Kubernetes technology.

Q2: You've been leading digital transformation and modernization initiatives for a while, in very complex, demanding organizations. Looking back at your career, what are some of the challenges (organizational, business, and technical) that you encountered with modernization initiatives?

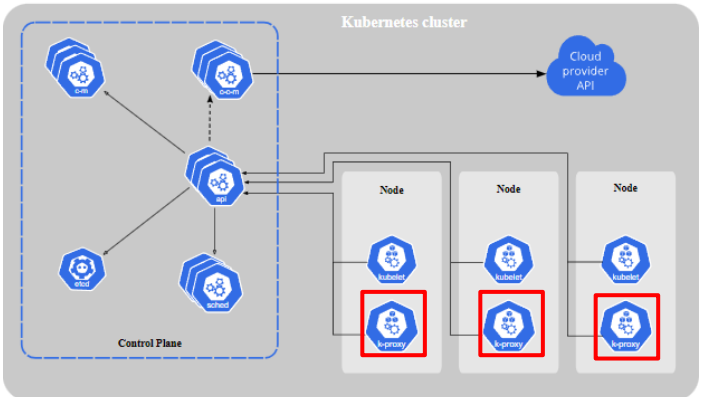

Jason: In late 2018, we started our digital transformation by creating a tenancy in Oracle Cloud Infrastructure (OCI) and iterating through multiple proofs of technology, first proving out that our on-premises applications could not only run functionally, but also run workloads as fast or even faster in OCI. Shortly after that, a core group of infrastructure team members (led by our brilliant technical delivery manager, Vijay Krishnaswamy) began learning the fundamentals of Kubernetes and related open source software. Despite their team having success migrating their applications into OCI in 2020 and then redeploying their applications into Kubernetes a year later, we faced a larger challenge with the team supporting Ventana, the core application that supports the AAdvantage program. The stakes were huge: Ventana is one of American Airlines' most important applications. Additionally, the team supporting it had not been directly involved in the journey forged by the other group.

When we merged both teams into one organization, encouraged team members to learn from and teach each other, and demonstrated sustained leadership support, we emerged with a crossfunctional team who achieved multiple certifications in both OCI and Kubernetes. They were then equipped with the skills, confidence, and support to move Ventana into not just OCI, but also Oracle Container Engine for Kubernetes (OKE) in one go.

U.S. Patent No. 7,949,785 (Claim 30)	
Claim(s)	Example American Count 3 Systems and Services
[30.pre] A virtual network manager, comprising:	<p>To the extent this preamble is limiting, on information and belief, the American Count 3 Systems and Services include a virtual network manager.</p> <p>The virtual network manager is the Kubernetes functionality related to DNS for Services and Pods.</p> <p><u>DNS for Services and Pods</u></p> <p><u>Kubernetes creates DNS records for Services and Pods.</u> You can contact Services with consistent DNS names instead of IP addresses.</p> <p>Kubernetes publishes information about Pods and Services which is used to program DNS. Kubelet configures Pods' DNS so that running containers can lookup Services by name rather than IP.</p> <p><u>Services defined in the cluster are assigned DNS names.</u> By default, a client Pod's DNS search list includes the Pod's own namespace and the cluster's default domain.</p> <p>Source: https://kubernetes.io/docs/concepts/services-networking/dns-pod-service/#pod-s-dns-config.</p> <p><u>A Service in Kubernetes is an abstraction which defines a logical set of Pods</u> and a policy by which to access them. Services enable a loose coupling between dependent Pods. A Service is defined using YAML or JSON, like all Kubernetes object manifests. The set of Pods targeted by a Service is usually determined by a <i>label selector</i> (see below for why you might want a Service without including a <i>selector</i> in the spec).</p> <p>Source: https://kubernetes.io/docs/tutorials/kubernetes-basics/expose/expose-intro/.</p> <p><u>Kubernetes assigns this Service an IP address (the <i>cluster IP</i>), that is used by the virtual IP address mechanism.</u> For more details on that mechanism, read Virtual IPs and Service Proxies.</p> <p>Source: https://kubernetes.io/docs/concepts/services-networking/service/.</p>

U.S. Patent No. 7,949,785 (Claim 30)	
Claim(s)	Example American Count 3 Systems and Services
	<p><u>Virtual IPs and Service Proxies</u></p> <p>Every node in a Kubernetes cluster runs a kube-proxy (unless you have deployed your own alternative component in place of kube-proxy).</p> <p>The kube-proxy component is responsible for implementing a virtual IP mechanism for Services of type other than ExternalName .</p> <p>Source: https://kubernetes.io/docs/reference/networking/virtual-ips/.</p>
[30.a] a network interface configured for data communication via a virtual network that is defined by a domain name having an associated public network address;	<p>On information and belief, the American Count 3 Systems and Services include a network interface configured for data communication via a virtual network that is defined by a domain name having an associated public network address.</p> <p>On information and belief, Kubernetes DNS for Services and pods is implemented in part through a network interface called kube-proxy, which maintains network rules that allow communication to pods from network sessions. Kube-proxy communications can relate to network sessions inside or outside of the cluster in which the services are defined. The services defined in the cluster are assigned DNS names having an associated public network address.</p> <p>Kubernetes Components</p>  <p>The diagram illustrates the Kubernetes architecture. On the left, the 'Control Plane' is enclosed in a dashed blue box and contains five Kubernetes master icons. In the center, three 'Node' boxes are shown, each containing a Kubernetes worker icon and a 'kube-proxy' icon. The 'kube-proxy' icons are highlighted with red squares. On the right, a 'Cloud provider API' icon is shown. Arrows indicate communication between the Control Plane and the Nodes, and between the Nodes and the Cloud provider API.</p>

U.S. Patent No. 7,949,785 (Claim 30)	
Claim(s)	Example American Count 3 Systems and Services
	<p>kube-proxy</p> <p><u>kube-proxy is a network proxy that runs on each node in your cluster, implementing part of the Kubernetes Service concept.</u></p> <p><u>kube-proxy maintains network rules on nodes. These network rules allow network communication to your Pods from network sessions inside or outside of your cluster.</u></p> <p>Source: https://kubernetes.io/docs/concepts/overview/components/#:~:text=kube%2Dproxy%20is%20a%20network,or%20outside%20of%20your%20cluster.</p> <p>DNS</p> <p>A cluster-aware DNS server, such as CoreDNS, watches the Kubernetes API for new Services and creates a set of DNS records for each one. If DNS has been enabled throughout your cluster then <u>all Pods should automatically be able to resolve Services by their DNS name.</u></p> <p>External IPs</p> <p><u>If there are external IPs that route to one or more cluster nodes, Kubernetes Services can be exposed on those externalIPs .</u> When network traffic arrives into the cluster, with the external IP (as destination IP) and the port matching that Service, rules and routes that Kubernetes has configured ensure that the traffic is routed to one of the endpoints for that Service.</p> <p>Source: https://kubernetes.io/docs/concepts/services-networking/service/.</p>

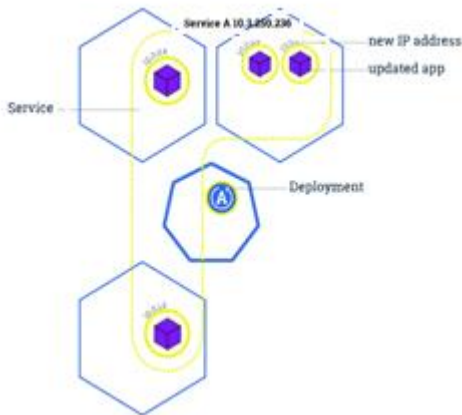

U.S. Patent No. 7,949,785 (Claim 30)	
Claim(s)	Example American Count 3 Systems and Services
	<p>DNS for Services and Pods</p> <p>Kubernetes creates DNS records for Services and Pods. You can contact <u>Services with consistent DNS names</u> instead of IP addresses.</p> <p><u>Services defined in the cluster are assigned DNS names.</u> By default, a client Pod's DNS search list includes the Pod's own namespace and the cluster's default domain.</p> <p>Source: https://kubernetes.io/docs/concepts/services-networking/dns-pod-service/#pod-s-dns-config.</p>
[30.b] a memory and a processor to implement a register module configured to register devices in a virtual network, the register module further configured to:	<p>On information and belief, the American Count 3 Systems and Services include a memory and a processor to implement a register module configured to register devices in a virtual network.</p> <p>On information and belief, a service runs on a set of pods. The Kubernetes DNS Service module watches the Kubernetes API for incoming new services and creates a set of DNS records for each of the pods associated with the service.</p> <p><u>Kubernetes runs your workload by placing containers into Pods to run on Nodes. A node may be a virtual or physical machine, depending on the cluster. Each node is managed by the control plane and contains the services necessary to run Pods.</u></p> <p>Source: https://kubernetes.io/docs/concepts/architecture/nodes.</p> <p>Initializing your control-plane node</p> <p><u>The control-plane node is the machine where the control plane components run, including etcd (the cluster database) and the API Server (which the kubectl command line tool communicates with).</u></p> <p>Source: https://kubernetes.io/docs/setup/production-environment/tools/kubeadm/create-cluster-kubeadm/.</p>

U.S. Patent No. 7,949,785 (Claim 30)	
Claim(s)	Example American Count 3 Systems and Services
	<p>DNS</p> <p>You can (and almost always should) set up a <u>DNS service for your Kubernetes cluster</u> using an add-on.</p> <p>A cluster-aware DNS server, such as CoreDNS, watches the Kubernetes API for new Services and <u>creates a set of DNS records for each one. If DNS has been enabled throughout your cluster then all Pods should automatically be able to resolve Services by their DNS name.</u></p> <p>For example, if you have a Service called <code>my-service</code> in a Kubernetes namespace <code>my-ns</code>, <u>the control plane and the DNS Service acting together create a DNS record for <code>my-service.my-ns</code>. Pods in the <code>my-ns</code> namespace should be able to find the service by doing a name lookup for <code>my-service</code> (<code>my-service.my-ns</code> would also work).</u></p> <p>Source: https://kubernetes.io/docs/concepts/services-networking/service.</p> <p>Services in Kubernetes</p> <p>The Service API, part of Kubernetes, is an abstraction to help you expose groups of Pods over a network. <u>Each Service object defines a logical set of endpoints (usually these endpoints are Pods) along with a policy about how to make those pods accessible.</u></p> <p>For example, consider a stateless image-processing backend which is running with 3 replicas. Those replicas are fungible—frontends do not care which backend they use. While the actual Pods that compose the backend set may change, the frontend clients should not need to be aware of that, nor should they need to keep track of the set of backends themselves.</p> <p>The Service abstraction enables this decoupling.</p> <p>The set of Pods targeted by a Service is usually determined by a <u>selector</u> that you define. To learn about other ways to define Service endpoints, see Services without selectors.</p>
[30.b.i] receive a registration request from an agent associated with a device;	<p>On information and belief, the American Count 3 Systems and Services include a register module configured to receive a registration request from an agent associated with a device.</p> <p>On information and belief, a service runs on a set of pods. The Kubernetes DNS Service module watches the Kubernetes API for incoming new services being made from the kubelet.</p>

	<p><u>Using CoreDNS for Service Discovery</u></p> <p>About <u>CoreDNS</u></p> <p><u>CoreDNS is a flexible, extensible DNS server that can serve as the Kubernetes cluster DNS.</u> Like Kubernetes, the CoreDNS project is hosted by the CNCF.</p> <p>You can use CoreDNS instead of kube-dns in your cluster by replacing kube-dns in an existing deployment, or by using tools like kubeadm that will deploy and upgrade the cluster for you.</p> <p>Source: https://kubernetes.io/docs/tasks/administer-cluster/coredns/ (last accessed on November 10, 2023)</p>

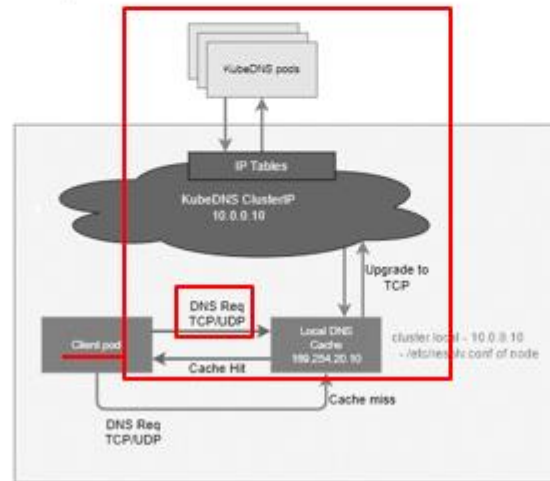

U.S. Patent No. 7,949,785 (Claim 30)

Claim(s)

Example American Count 3 Systems and Services

Introduction

NodeLocal DNSCache improves Cluster DNS performance by running a DNS caching agent on cluster nodes as a DaemonSet. In today's architecture, Pods in 'ClusterFirst' DNS mode reach out to a kube-dns serviceIP for DNS queries. This is translated to a kube-dns/CoreDNS endpoint via iptables rules added by kube-proxy. With this new architecture, Pods will reach out to the DNS caching agent running on the same node, thereby avoiding iptables DNAT rules and connection tracking. The local caching agent will query kube-dns service for cache misses of cluster hostnames ("cluster.local" suffix by default).

U.S. Patent No. 7,949,785 (Claim 30)	
Claim(s)	Example American Count 3 Systems and Services
	<p>Pod foo</p> <p>When a pod sends an API request to a service within the same Kubernetes cluster, it must first resolve the IP address of the service. To do this, the pod performs a DNS lookup using the DNS server specified in its <code>/etc/resolv.conf</code> configuration file.</p> <p>This file, which is provisioned by the Kubelet, defines the settings for DNS lookups in the pod. It contains a reference to the cluster DNS server.</p> <p>By default, this configuration file looks something like this:</p> <pre>search namespace.svc.cluster.local svc.cluster.local cluster.local nameserver 10.123.0.10 options ndots:5</pre> <p>Source: https://www.nslookup.io/learning/the-life-of-a-dns-query-in-kubernetes/.</p>

U.S. Patent No. 7,949,785 (Claim 30)

Claim(s)

Example American Count 3 Systems and Services

DNS lookups on services

The flow of a DNS query in Kubernetes. By Nslookup.io. Licensed under [CC By 4.0](#).

Source: <https://www.nslookup.io/learning/the-life-of-a-dns-query-in-kubernetes/>.

U.S. Patent No. 7,949,785 (Claim 30)	
Claim(s)	Example American Count 3 Systems and Services
	<p>When a pod performs a DNS lookup, the query is first sent to the local DNS resolver in the pod. This resolver uses the resolv.conf configuration file. In this file, the nodelocaldns server is set up as the default recursive DNS resolver, which acts as a cache.</p> <p>If this cache does not contain the IP address for the requested hostname, the query is forwarded to the cluster DNS server (CoreDNS).</p> <p>This DNS server determines the IP address by consulting the Kubernetes service registry. This registry contains a mapping of service names to their corresponding IP addresses. This allows the cluster DNS server to return the correct IP address to the requesting pod.</p> <p>Any domains that are queried but are not in the Kubernetes service registry are forwarded to an upstream DNS server.</p> <p>We will go through each of these components in more detail step-by-step.</p> <p>Source: https://www.nslookup.io/learning/the-life-of-a-dns-query-in-kubernetes/.</p> <p>On information and belief, American's systems include "a private network address associated with a second device in the virtual network, and a virtual network address associated with the second device."</p> <p>On information and belief, the private network address associated with a second device is a unique private IP address assigned to a backend node. The virtual network address associated with the second device is the Cluster IP or Virtual IP assigned to a pod (or pods) and/or container (or containers). .</p>

U.S. Patent No. 7,949,785 (Claim 30)	
Claim(s)	Example American Count 3 Systems and Services
	<div data-bbox="989 310 1545 768">  CoreDNS ≡ <h2>kubernetes</h2> <p>Source</p> <hr/> <p>kubernetes enables reading zone data from a Kubernetes cluster.</p> <h3>Description</h3> <p>This plugin implements the Kubernetes DNS-Based Service Discovery Specification.</p> <p>CoreDNS running the kubernetes plugin can be used as a replacement for kube-dns in a kubernetes cluster. See the deployment repository for details on how to deploy CoreDNS in Kubernetes.</p> </div> <div data-bbox="840 812 1705 1346">  CoreDNS <h2>Metadata</h2> <p>The kubernetes plugin will publish the following metadata, if the metadata plugin is also enabled:</p> <ul style="list-style-type: none"> • <code>kubernetes/endpoint</code>: the endpoint name in the query • <code>kubernetes/kind</code>: the resource kind (pod or svc) in the query • <code>kubernetes/namespace</code>: the namespace in the query • <code>kubernetes/port-name</code>: the port name in an SRV query • <code>kubernetes/protocol</code>: the protocol in an SRV query • <code>kubernetes/service</code>: the service name in the query • <code>kubernetes/client-namespace</code>: the client pod's namespace (see requirements below) • <code>kubernetes/client-pod-name</code>: the client pod's name (see requirements below) <p>The <code>kubernetes/client-namespace</code> and <code>kubernetes/client-pod-name</code> metadata work by reconciling the client IP address in the DNS request packet to a known pod IP address. Therefore the following is required:</p> <ul style="list-style-type: none"> • <code>pods-verified</code> mode must be enabled • the remote IP address in the DNS packet received by CoreDNS must be the IP address of the Pod that sent the request. </div>
